# 1 Path Finding Algorithm Analysis, Spring 2020

## 1.1 Group 2 - Object Oriented Software Design

## 1.2 Adam Corbin - April 2020

# 2 Functional Specification

# 3 Description

This application will dive into the different types of path finding algorithms games use in order to come up with the generated path when a character or player selects a destination position. This project will have a visual progression of the algorithms so that a human can see how well they preform between each other. I would like to evaluate different situations to find positives and negatives between the algorithms such as best case and worst-case scenarios. Statistic analysis will also be done to evaluate how well they rank between each other.

## 3.1 List of things that this program will do

- Visual graph representing at least 1 or more algorithms running over time
- A way to view the results between the different algorithm
- A way for a human to pick start and destination points.

- A way to auto pick start and destination points

This will run on Windows 10 OS using Swing

### 3.2 Intended users

- Any game developers who want to consider different options for path finding.
- Anyone who wants to understand how path finding algorithms work.

## 4 Application Requirements

### 4.0.1 Functional Requirements

1. **F.R-1:** The system shall generate a path given a start point, and end point, and the selected algorithm
2. **F.R-2:** The system shall let the user know if a path is not possible to be created
3. **F.R-3:** The system shall provide statistics on the different algorithms
4. **F.R-4:** The system shall find worst case scenario for each algorithm given the scenario
5. **F.R-5:** The system shall run a simulation to compare the differences between the algorithms using simple statistics
6. **F.R-6:** The system shall be able to generate a new random graph
7. **F.R-7:** The system shall be able to generate a new random start and end position

### 4.0.2 UI Requirements

1. **UI.R-1:** The UI shall be able to select a starting point and an end point
2. **UI.R-2:** The UI shall have a button to start the simulation
3. **UI.R-3:** The UI shall be able to see the algorithms behave over time where a human can visually see
4. **UI.R-4:** The UI shall have the ability to auto pick the 2 points
5. **UI.R-5:** The UI shall have the ability to select which algorithms to use for the simulation
6. **UI.R-6:** The UI shall have a table comparing the different algorithms
7. **UI.R-7:** The UI shall have multiple size graphs to pick from

### 4.1 Use Cases

#### 4.1.1 UC-1: User selects a path

1. The user selects the start and end points and uses default algorithm
2. The system computes the path generation
3. The system displays a successful path

#### 4.1.2 UC-2: User selects a path

##### 4.1.2.1 Variation #1: Invalid path

1. After step 2 , the system displays the path could not be found

#### 4.1.3 UC-3: Computer generates path

1. The user selects for the system to pick 2 random points on the graph
2. The system picks 2 random points
3. The system computes the path generation
4. The system displays a successful path

#### 4.1.4 UC-4: Computer generates path

##### 4.1.4.1 Variation #1: Invalid path

1. After step 2, the system displays that the path could not be found

#### **4.1.5 UC-5: User selects a different algorithm**

1. The user selects the start and end points
2. The user changes the default algorithm to another selection
3. The system computes the path generation
4. The system displays the successful path

#### **4.1.6 User selects points from history**

1. The user picks from this history list to switch back to
2. The system regenerates the path from the history
3. The system displays the generated path

#### **4.1.7 UC-6: System populates algorithm comparator**

1. The user selects all the algorithms to run for the simulation
2. The user picks the 2 points
3. The system generates the paths for each algorithm
4. The system displays a ranking order between each algorithm with some statistics.

### **4.2 Use Cases updated after GUI elements**

#### **4.2.1 UC-1: User selects a path**

1. The user enters the coordinates in the start position text field and end position text field
2. The user selects the first algorithm JComboBox
3. The user presses the Generate Path button
4. The system computes the path generation
5. The system displays a successful path on the grid JComponent

#### **4.2.2 UC-2: User selects a path**

##### **4.2.2.1 Variation #1: Invalid path**

1. After step 2 , the system displays no the path on the graph

#### **4.2.3 UC-3: Computer generates path**

1. The user presses the generate Generate Random Path button
2. The system picks 2 random points and fills in the start and end JTextField with the positions
3. The user presses the Compute Path buttons
4. The system computes the path generation
5. The system displays a successful path on the grid JComponent

#### **4.2.4 UC-4: Computer generates path**

##### **4.2.4.1 Variation #1: Invalid path**

1. After step 2, the system displays that the path could not be found

#### **4.2.5 UC-5: User selects a different algorithm**

1. The user enters the coordinates in the start position text field and end position text field
2. The user checks the a different algorithm JComboBox than the first
3. The user presses the Generate Path buttons
4. The system computes the path generation
5. The system displays a successful path on the grid JComponent

#### **4.2.6 UC-6: System populates algorithm comparator**

1. The user enters the coordinates in the start position text field and end position text field
2. The user presses the Compute Comparison buttons
3. The system generates the paths for each algorithm
4. The system displays the results between each algorithm with some statistics in the algorithm results JTable

#### **4.2.7 UC-7: Generate New Graph**

1. The user presses the New Graph button
2. the system will clear the graph JComponent
3. the system will then repopulate GridModel blocking elements
4. The system will then repaint the graph JComponent

#### **4.2.8 UC-8: Generate graph from text fields**

1. The user enters the coordinates in the start position text field and end position text field
2. The system automatically computes the path generation
3. The system displays a successful path on the grid JComponent

## **5 User Interface**

### **5.1 Mockup**

Link: <https://gomockingbird.com/projects/v95sylo/4gXVnC>

## **6 Design Specification**

### **6.1 CRC cards**

#### **6.1.1 Tile**

- Responsibilities
  - Coordinate on a map that is used to represent a node or a position
- Collaborators
  - Path

#### **6.1.2 Path**

- Responsibilities
  - An ordered list of tiles that will be used to represent chain of tiles to get from start to finish
- Collaborators
  - Tile
  - Algorithm
  - AlgorithmController

#### **6.1.3 Algorithm**

- Responsibilities
  - Steps to find a path between a departure and destination position
- Collaborators
  - AlgorithmController
  - Path

New Graph

<- this will generate a new graph with walls or blocked areas

<- This graph will have zoom capabilities or at least the whole graph will be shown here.

Within the graph you can right click a tile/position and set the start and end position

Start position

End position

<- the start and end positions can be text edible

Generate Random Start/End positions

☐ Algo 1

☐ Algo 2

☐ Algo 3

Compute Path

<- Runs the simulation

Stat	Algo1	Algo2
Path Found		
Runtime		
Nodes		
Ram usage		
etc.		

7

#### 6.1.4 Grid

- Responsibilities
  - Showing start and end tiles of a path
  - showing the different paths for the algorithms
  - Showing the visited tiles of the algorithms
- Collaborators
  - GUIView
  - Path
  - Tile

#### 6.1.5 GridTile

- Responsibilities
  - Keeping track of what colors should the tile display in the grid
  - collision flag of the tile
- Collaborators
  - Grid

#### 6.1.6 AlgorithmController

- Responsibilities
  - Keeping track which algorithms are selected
  - Running the simulations
  - Keeps track of past history of the departure and destination tiles
  - Simulator that runs the algorithms and collects the comparative results
  - Keeps track of the tiles visited while going through the algorithm
  - Keeps track of optimized path for each algorithm
- Collaborators
  - GUIView
  - Grid
  - Algorithm

#### 6.1.7 GUIView

- Responsibilities
  - Displaying the grid
  - Displaying the start and end positions
  - Selectable algorithms
  - Displaying the comparison results of the different algorithms
  - Selectable history of past start and end positions
- Collaborators
  - AlgorithmController

### 6.2 UML Diagrams

#### 6.2.1 Patterns

- Observer pattern All the buttons, text fields, and JComboBoxes with Action listeners

Name in Design Pattern	Actual Name
Subject	JButton & JComboBox, JTextField
Observer	ActionListener

Name in Design Pattern	Actual Name
ConcreteObserver	AlgorithmController has 4 buttons, 2 JComboBoxes, and 2 JTextFields with action listeners it implemented
attach()	addActionListener
notify()	actionPerformed

- Singleton - The GUIView uses a Singleton pattern. I couldnt find a table in the book for this pattern.
- Composite pattern - GridTiles with parent as an object. This is used to build the path where GridTiles link between each other

Name in Design Pattern	Actual Name
Primitive	GridTile
Composite	GridTile it self
Leaf	Tile
method()	getParent()

- Adapter pattern - With AlgotStatsModel updating table

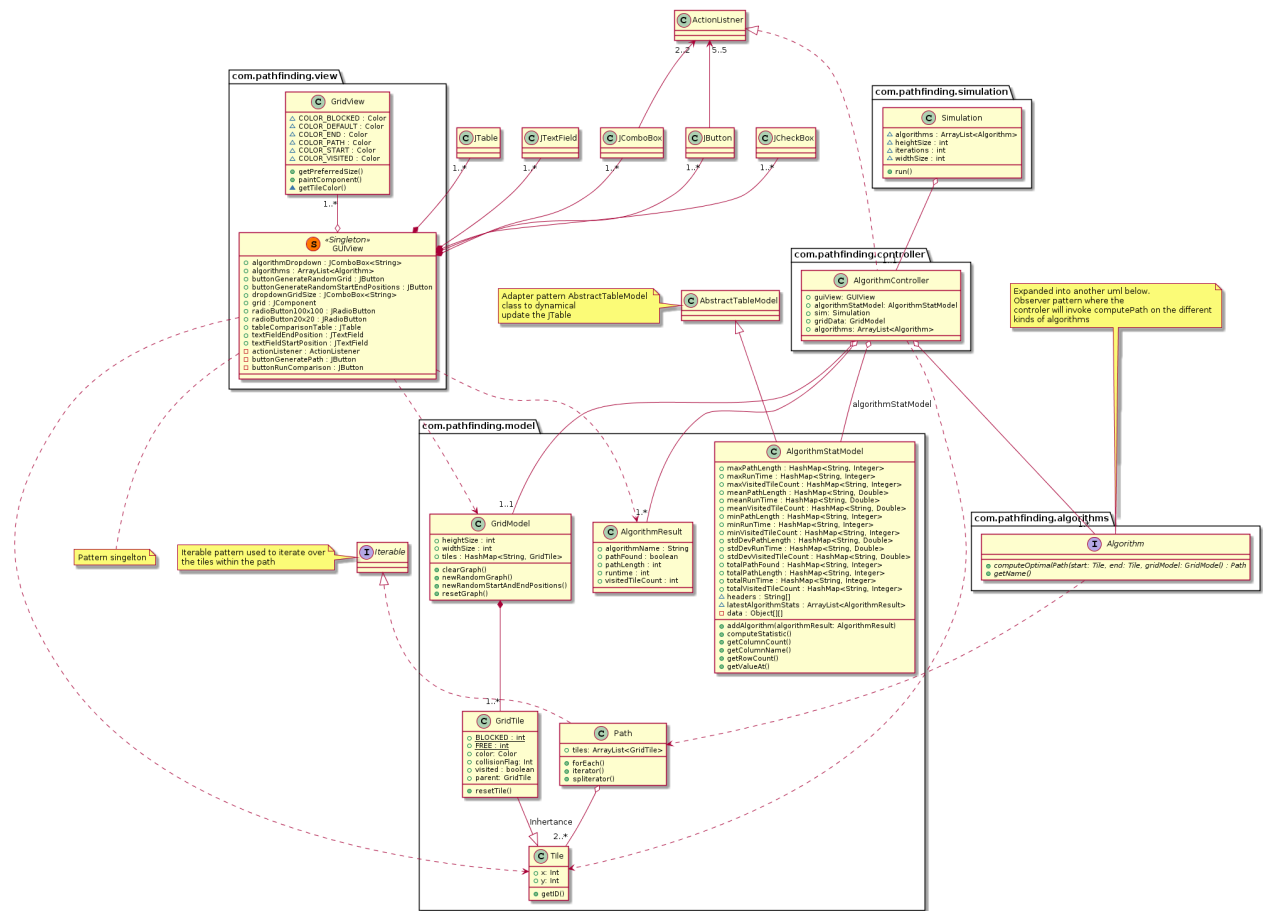

Name in Design Pattern	Actual Name
Adaptee	JTable
Target	AlgorithmStatModel
Adapter	AbstractTableModel
Client	The class that wants to add rows to a table
targetMethod()	fireTableDataChanged()
adapteeMethod()	getValueAt(),getColumnCount(), getRowCount(), getColumnName()

- Strategy pattern - GridBag

Name in Design Pattern	Actual Name
Context	GUIView
Strategy	LayoutManager
ConcreteStrategy	GridBagLayout
doWork()	A method of the LayoutManager interface type such as layoutContainer

## 6.2.2 Class diagrams

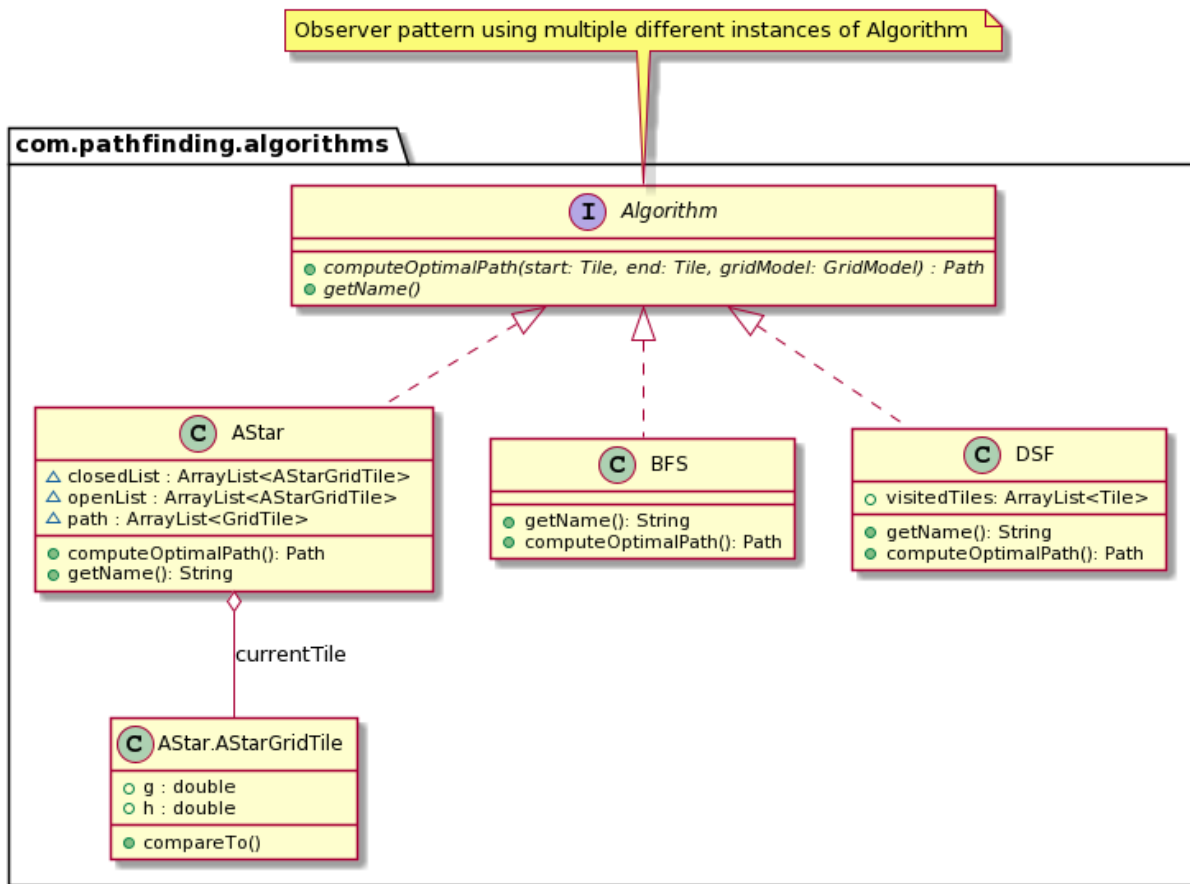

### 6.2.2.1 Overall UML Diagram

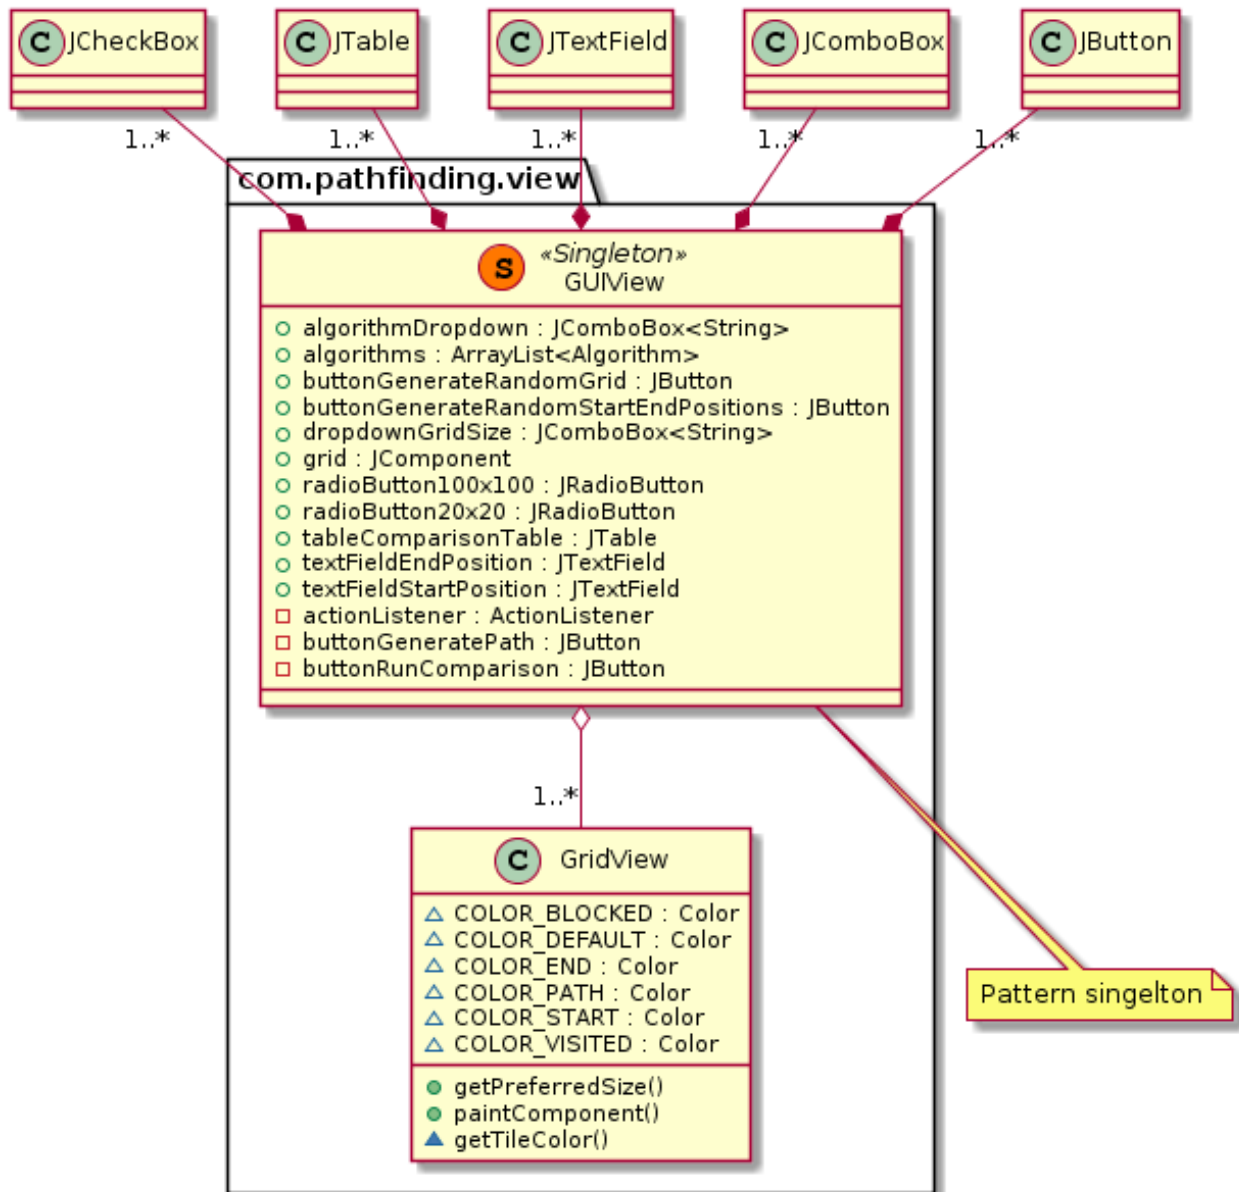

Clear picture in link below. Also opening PDF All uml diagrams are clickable to a PNG that can be zoomed in:

15         Tile t = new Tile(1, 5);
16
17         assertEquals("1,5", t.getID());
18
19     }
20 }

```

## 9 Glossary

- **Path Algorithm** - A set of instructions to iterate over the points to find a way from point A to point B
- **Start, departure point** - the first node in the path
- **End, destination point** - the last node in the path
- **Node, Tile, Point** - Each term here represents an coordinate in a 2 dimensional graph. They will be used in a group to represent a path
- **Path** - a group of nodes,tiles,points that make up an array of elements used describe how to get from point A to point B
- **Results** - a comparison between multiple algorithms
- **Simulation** - the even when all the algorithms will be run against a graph to compare the results
